# We reduced Detected Plagiarism Rate

# Academic Honesty

*As a society, we rely on the **academic** and journalistic **integrity** of other people's work. The **whole point of academic research** is to share knowledge with others and learn from one another. Since knowledge and ideas are the primary product produced by academic communities, it is **essential that this knowledge is accurate** and gives credit to those who created it.*

University of Ontario. 2016. Why is Academic Integrity and Honesty Important ?

## Cheating on Projects 1 and 3

Class,

Unfortunately, after a additional analysis of the project 1 and 3 submissions, it has become clear that several students have submitted plagiarized code, or code directly retrieved from another student's repository.

For these students in question, we will give 48 hours (12:00PM 16 JUL 16) to put a private note on Piazza for the Instructors' team with information of where you got the answers from and will only receive a zero for the assignment. Otherwise, those who do not self report will still get a zero and be reported to the Office of Student Integrity and called for a hearing.

For students who worked hard and were honest, we're sorry for this situation. For the students in question, we already know who you are so it would be wise to come forward now, not further waste anyone's time and just take the zero for the assignment.

# Amnesty

- Not **one** student we suspected came forward
- **Multiple** students came forward but had not cheated.

# Increasing Plagiarism

## Collaboration versus Cheating

Our goal in CS-4200 is to provide you with a great opportunity to learn more about operating systems. Part of that is a series of projects that you will be asked to implement in the class.

Collaboration is a very good thing. On the other hand, cheating is considered a very serious offense and is vigorously prosecuted. Vigorous prosecution requires that you be advised of the cheating policy of the course before the offending act.

If you obtain help of any kind, always write the name(s) of your sources in the project README file.

This document describes what is acceptable collaboration versus unacceptable plagiarism for this class. Note that ultimately, this is an essential part of the Georgia Tech Honor Code.

## Collaboration

Collaboration is essential to both the learning experience in this class as well as in the real world. Collaboration is working with other people cooperatively to enhance understanding.

We encourage you to:

- Share ideas
- Explain your code to someone to see if they know why it doesn't work.
- Help someone else debug if they've run into a wall.

Ideally, we'd like to see you do this via Piazza, in public threads. That creates transparency and allows other students to also participate in the conversation as well as learn from it.

## Plagiarism

Plagiarism is using someone else's work instead of doing your own work:

- Never share code or test on the project.
- Never use someone else's code or test in your solutions.
- Never commit project code or test that you find anywhere, such as the Internet.

The one exception here is that you may use small snippets of code for commonly performed tasks (e.g., creating a socket, or translating a host name to an IP address), provided that you properly reference the usage and explain what the code does in your README file.

Note: a "snippet" is less than 10 lines of code. If we find you used 11 lines of code once in your project, we aren't likely to say anything. But let me show you a real-world example of this:

What do you think the odds are that two different students would write exactly the same code? Here's an experiment for you: try rewriting code that you previously have written without looking at that older code. Then compare them. If you can't write the same code twice, what do you think the odds are that someone else will?

That image is from one of the tools that we use in this course. It is not the only mechanism that we use, it just happens to be the most well known of them. There's even a public GitHub that discusses techniques for bypassing it: <https://github.com/gonchar1234/low-to-cheat-in-computer-science-101>

Here's the interesting bit of it - if you actually do all the work necessary to escape detection, by the time you're done, you'll have done more work than if you had just done your own work.

Here's one of the best descriptions about cheating (and why every excuse doesn't work) I've ever read: <http://www.cs.ubc.ca/~tm/courses/cheat.html>

Here's an amazing description of why this matters: <https://course.apsu.edu/cs/cs420/lects/IntegratingModule1/Module13.html>

If by chance you

ist efforts, we sometimes find students cheating. While this comes in a number of forms, we do not tolerate it because it is not help you learn the material and cheating does not achieve that goal.

ity for cheating is that you deprive yourself of the learning opportunity. In addition to disappointing yourself, you also disappoint the material.

ered as scholarly misconduct. The actual penalty for cheating may consist of not receiving any points on the assignment, failure to your status as a Georgia Tech student, including expulsion from the program. The details are on the [OSI website](#).

# Establishing Expectations

# Collaboration versus Cheating

**Our goal** in CS-6200 is to provide you with a great **opportunity to learn** more about operating systems. Part of that is a series of projects that you will be asked to implement in the class.

Collaboration is a very good thing. On the other hand, cheating is considered a very serious offense and is vigorously prosecuted. Vigorous prosecution requires that you be advised of the cheating policy of the course before the offending act.

**If you obtain help** of any kind, **always** write the name(s) of your sources in your project report.

This document describes what is acceptable collaboration versus unacceptable plagiarism for this class. Note that ultimately, this is an essential part of the **Georgia Tech Honor Code**.

Plagiarism is using someone else's work instead of doing your own work:

Never share code or text on the project.

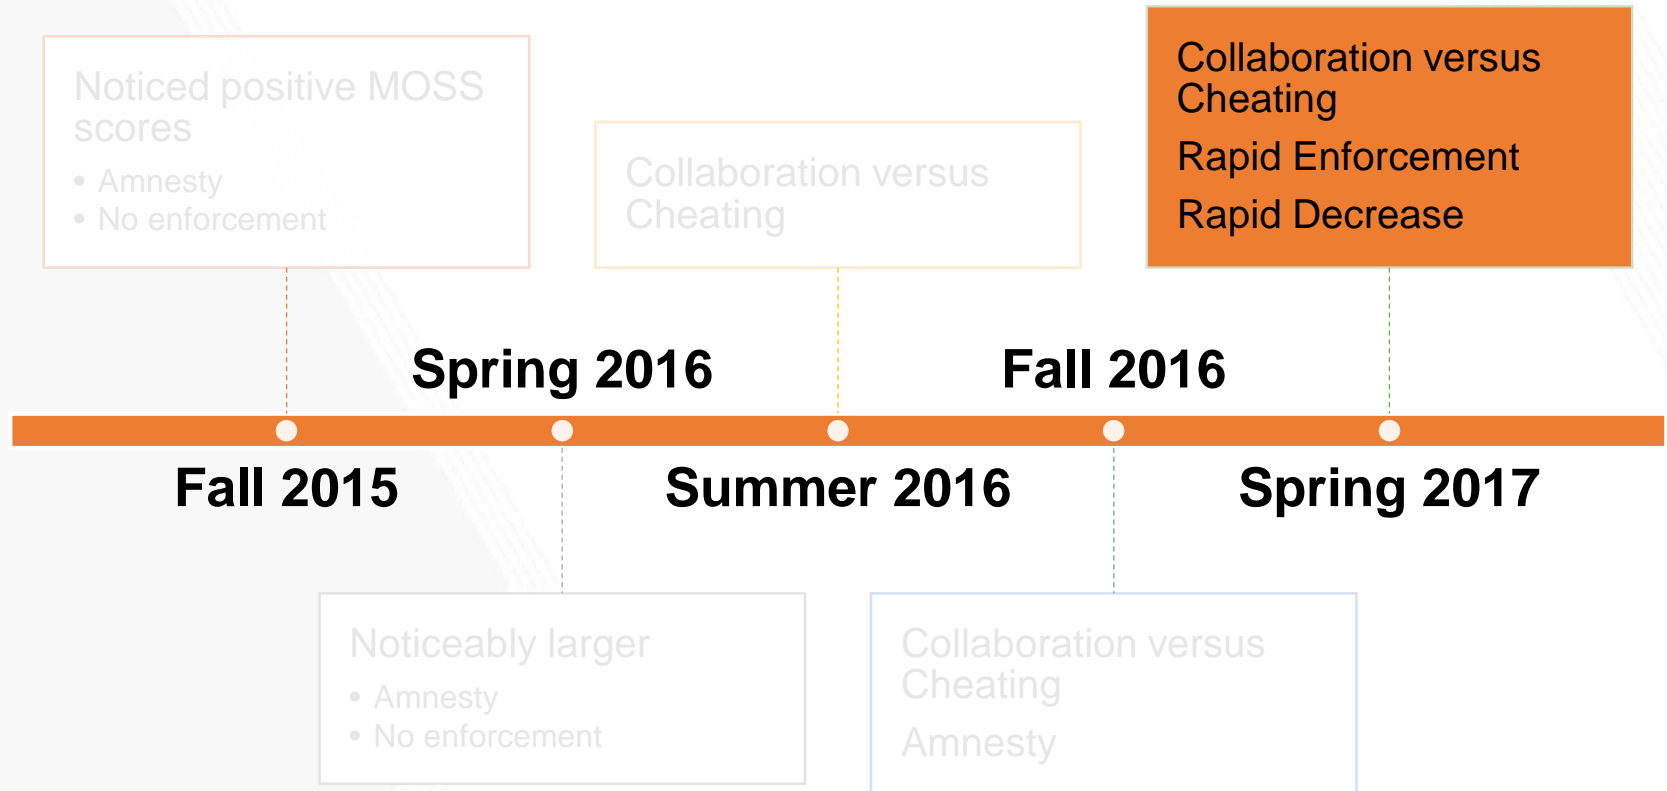

Never use someone else's code or text in your solutions.

Never consult project code or text that you find anywhere, such as the Internet

**Cheating is considered as scholarly misconduct.** The actual penalty for cheating may consist of not receiving any points on the assignment, failing the class, or may have more serious consequences to your status as a Georgia Tech student, including expulsion from the program. The details are on the [OSI website](#).

This is **not** what we want to do - but we have done it in the past. Nobody wants to face a formal review board hearing, presented with evidence of cheating and forced to defend their actions.

Why do we do it? Because if we don't, OMSCS gets a poor reputation and that diminishes the value of the program (and the degree) for the vast majority of students that don't cheat.

# Increasing Plagiarism

# Enforcement

Spring 2016

- Project 1 – Rapid contact/enforcement
- Project 2 – 0% measured plagiarism rate
- Enforcement is time-intensive

Goal: find a less time-intensive mechanism

## Question 1

1 pts

**From:** "Galil, Zvi" <galil@cc.gatech.edu>

**Subject:** [Oms-fac] Note for OMS students

**Date:** March 14, 2017 at 11:45:51 AM EDT

**To:** "omscs-official@cc.gatech.edu" <omscs-official@cc.gatech.edu>

Hello OMS CS students,

Most of my messages to you are about great news concerning the College or OMS CS. Unfortunately today's note is a bit more serious, and it's one I hope all of you read and take to heart. It's come to my attention that incidents of plagiarism are rising among our OMS student population, and as a community we must not only reverse this trend but eliminate it. It should go without saying that when you present someone else's work as your own, you are violating Georgia Tech's [Academic Honor Code](https://policylibrary.gatech.edu/student-affairs/academic-honor-code) (<https://policylibrary.gatech.edu/student-affairs/academic-honor-code>), and this will not be tolerated. It could even impact your career.

One particular source of concern is when students post their assignments publicly on Github (or similar services) and leave them there—even after they graduate. Other students find this code, and some have copied it for their own assignments. All of you should be aware that we use sophisticated software to compare your work to what is "out there" on the web, and it is as easy for us to detect plagiarism of this kind as it is dangerous for you to engage in it.

The simple message is: Don't do it. And for the students who utilize Github as a professional portfolio, you should know that if an investigation reveals your code has been used in someone else's assignment, you will be implicated in the situation and asked questions. If you'd like to avoid this headache, consider limiting access to your Github repository.

Tomorrow I'll send a much more positive message about more great press OMS CS has received recently. The reason we get this good coverage is that Georgia Tech and OMS CS enjoy a sterling academic reputation, and one cornerstone of that reputation is academic integrity. Please help us maintain and nurture that reputation.

Thanks for your help!

Zvi Galil

John P. Imlay Jr. Dean of Computing

**Please confirm that you have read and understood the above statement from Dean Galil:**

- 
- ☐ I confirm
- 
- ☐ I do not confirm

## Question 2

1 pts

**Please confirm that you have read and understood the clarification on Collaboration vs. Cheating posted in [Piazza post @11](https://piazza.com/class/jh58qa7wyb92kh?cid=11) (<https://piazza.com/class/jh58qa7wyb92kh?cid=11>).**

- 
- ☐ I confirm
- 
- ☐ I do not confirm

# It worked!

# Evaluation

Plagiarism: MOSS similarity score of  $> 30\%$

Project 1 has four distinct components

Project 2 has two distinct components

# Enforcement Revisited

Fall 2018 – resumed rapid enforcement

- Improved automation
- Scripted MOSS anonymization, report generation

Fewer cases = lower burden

Delayed enforcement = ineffective

# Future Work

# Beyond MOSS

What more can we do  
to detect plagiarism?

How to detect false  
negatives?

SINGLE COMMENT THREAD [VIEW ALL](#)

Fsgeek • 103d

Yes, this program uses MOSS - I just had a paper accepted to SIGCSE 2019 on how we reduced plagiarism in one of the OMSCS courses (not SDP) and the measurements are based on MOSS; in fact I *just* finished running MOSS on the submissions from the latest project submissions this morning - all 12 semesters of it. Of course there are cases that I'll have to report but I almost have the entire process automated from beginning to end (the next step is to scrape the MOSS web pages into RTF documents to submit them to OSI. When I'm at that point I'll be able to do this in a few hours for a 400 person class.)

... Edit ↑ 2 ↓

mosssucksass • 3d

MOSS is easy to trick. And, if that fails, it's easy to trick the person who will read your code. A lot of my code from my undergrad was just copied from github and I have never been caught once. The only cheaters you will catch are the stupid ones.

... ⚙️ ↶️ ⬆️ Vote ⬆️

# CS 6200 Detection Improvements (1)

Automatically  
build git repo  
from submission  
history

- Each of the past 50 submissions are saved
- Time series analysis is useful for enforcement

Automate  
evaluating  
checksums

- Each submission contains file checksums
- Detects submission script tampering
- Detects prior semester code used

## CS 6200 Detection Improvements (2)

Improve  
“take down”

- Starter code now includes a LICENSE file

Automate  
analysis of  
watermarks

- Starter code is modified each semester
- Change constants, order of headers, order of options
- Change function signatures

# Contract Programming

## Contracting out Homework is another issue

- More difficult to detect
- Prior work

## Using AI techniques: *Jack Watson*

- Evaluate projects on contract websites
- Pose as contractors
- Other?

*Note: this is ongoing research*

# Summary

Clearly explain class policy

- What constitutes plagiarism
- Penalties of getting caught

Include an assessment

Statistically significant decrease in detected plagiarism

**Questions?**
